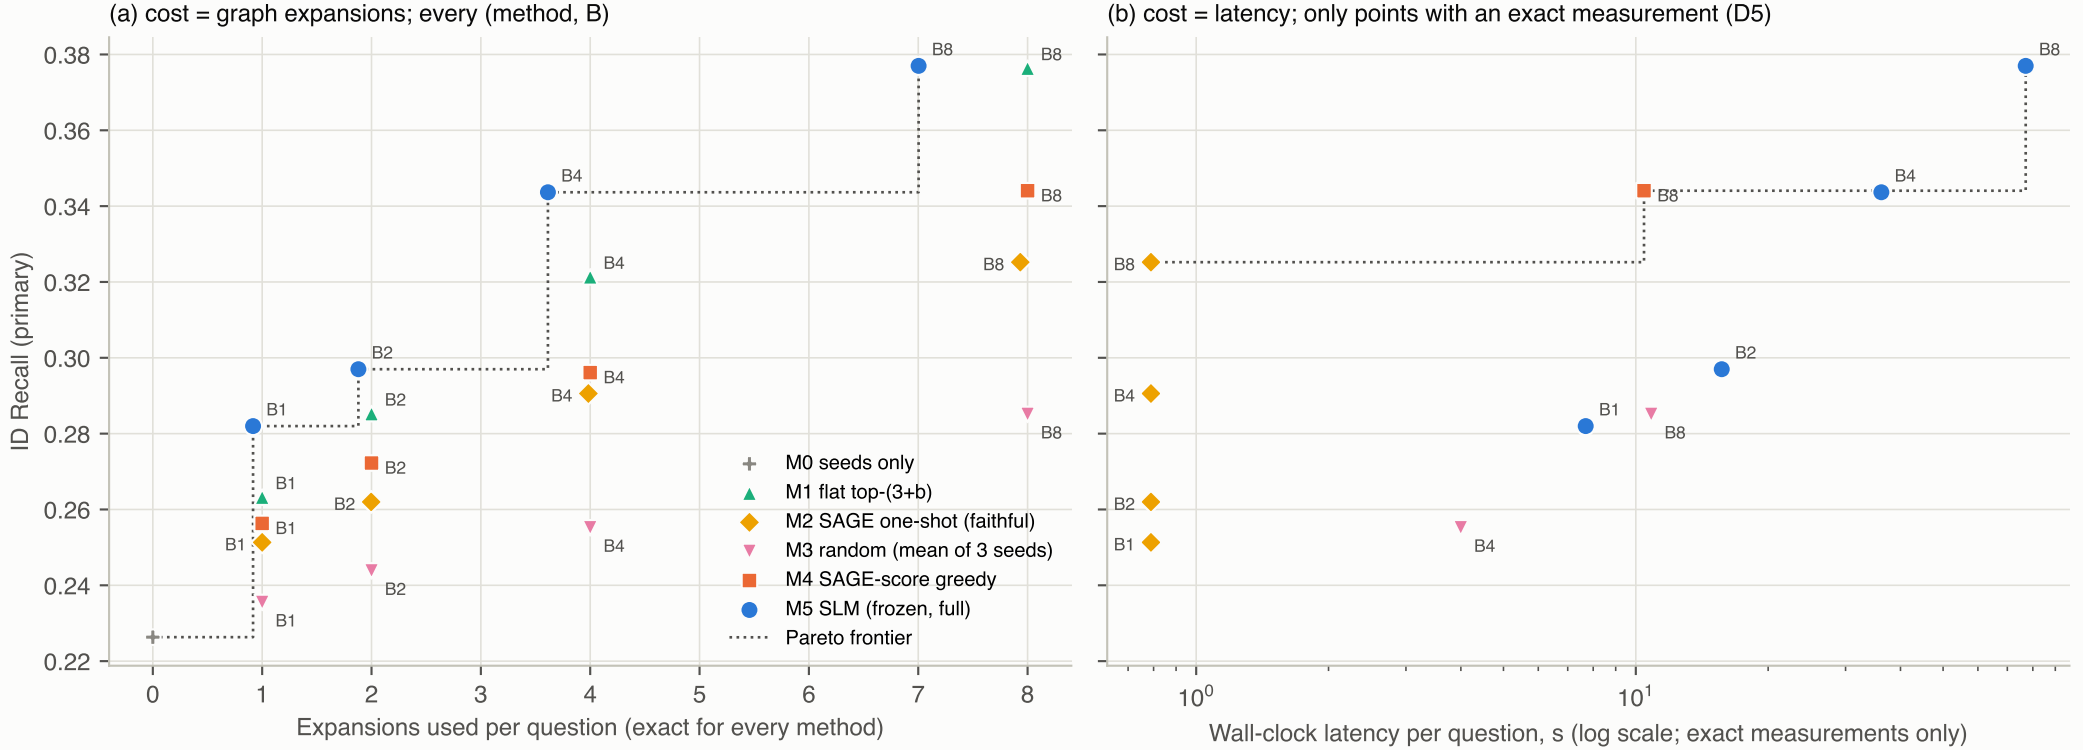
F2. ID Recall vs retrieval cost, SUB-300 (n = 300), B = 1, 2, 4, 8 (B = 0 for M0)



Each point is one (method, B); labels give B. M0 = seeds only (B = 0). Panel (b) omits M0/M1 (no added retrieval cost beyond the shared seed retrieval), M3 at B = 1/2 and M4 at B < 8 (no exact per-step latency logged). Frontier = points not beaten on both cost and recall. Source: analysis/scores/aggregates.json.
